There are two types of system available in electric circuit, single phase and three phase system.In single phase circuit, there will be only one phase, i.e the current will flow through only one wire and there will be one return path called neutral line to complete the circuit. So in single phase minimum amount of power can be transported.

Top, so-called phase 3 or voltage-dependent refractoriness. The first stimulus (arrow) falls on an early phase 3 and fails to elicit a response. The second stimulus falls in late phase 3 and results in an abbreviated, slowly rising AP of low amplitude. The third stimulus that falls at the end of repolarization results in a full AP.
