...

Clinical trials evaluating the benefits of low-dose aspirin (ASA) have used a wide range of doses from 60mg to 150mg orally daily with low-dose being defined as less than 325mg per day. Taking ASA (as opposed to placebo) is thought to reduce the risk of preeclampsia by 17%, without increasing the risk of major obstetric bleeding.

Low Doses of Aspirin in the Prevention of Preeclampsia ...

Because low-dose aspirin (LDA) can maintain the balance between prostacyclin and thromboxane, it is thought to help prevent preeclampsia and related complications. Indeed, numerous studies have suggested that antiplatelet agents such as prophylactic LDA can prevent gestational hypertension and preeclampsia in patients with high-risk pregnancies, 5 , 6 and

Guidance: Aspirin for Prevention of Pre-eclampsia

Pre-eclampsia is a common and serious complication of pregnancy that affects both mother and child. Review of previous small trials of antiplatelet therapy, particularly low-dose aspirin, suggested reductions of about three-quarters in the incidence of pre-eclampsia and some avoidance of intrauterine growth retardation (IUGR), but larger trials have not confirmed these results.

CLASP: a randomised trial of low-dose aspirin for the ...

Can taking low-dose aspirin help reduce your risk for preeclampsia and premature birth? For some women, yes. If your provider thinks you're at risk for preeclampsia, he may want you to take low-dose aspirin to help prevent it. Low-dose aspirin also is called baby aspirin or 81 mg (milligrams) aspirin.
