...

Pharmaceutical excipients are essential components of most modern dosage forms. Although defined as pharmacologically inert, excipients can be thought of as the true enablers of drug product performance. Unintentional variability in the properties of the excipients may be unavoidable, albeit minimizable.

Modified Excipients for Smart Drug Delivery System

Ideal properties of an excipient Excipients range from inert and simple to active and complex substances that can be difficult to characterize. Traditionally, excipients were often structurally simple, biologically inert, and of natural origin, such as corn, wheat, sugar, and minerals.

The intended function of an excipient is to guarantee the required physicochemical and biopharmaceutical properties of the pharmaceutical preparation. The US National Formulary gives a list of the excipient categories (Table 4, opposite). Some excipients are multi-functional, which means they belong to different categories.

The central role of excipients in drug formulation ...

Excipients are integral components of pharmaceutical drug products. The structure of a dosage form and its function in drug delivery is largely determined by excipients. Excipients are known to significantly influence the processability, aesthetics, performance, and/or patient compliance associated with a dosage form.

Generally, an excipient has no medicinal properties. Its standard purpose is to streamline the manufacture of the drug product and ultimately facilitate physiological absorption of the drug. Excipients might aid in lubricity, flowability, disintegration, taste and may confer some form of antimicrobial function.
