Water use Most of the potential shale gas basin in Australia are located in semi-arid to arid regions and are therefore mostly reliant on slowly recharged groundwater. A fully developed shale gas industry in an arid area has the potential to become a major use relative to sustainable r of groundwater extraction levels.

oil and gas industry. The ACOLA report specifically addressed aspects of shale gas production. Natural gas production from deep shale shares attributes with production from other sources of natural gas; including tight gas and to a lesser extent coal seam gas. Key differences are i) natural gas production from shale will likely have a larger

3b) Methane in water supplies near shale gas wells . Osborn et al (2011) report methane in ground water supplies near shale gas wells in Pennsylvania. Other authors (King 2012, Daily Journal 2011) point out that methane also occurs in water wells in areas with no shale gas drilling. The source of this methane is not well understood.

Shale gas refers to natural gas that is trapped within shale formations. Shales are fine-grained sedimentary rocks that can be rich sources of petroleum and natural gas (see Fig. 1.4). Shale gas is trapped within the pores of this sedimentary rock. Gas is normally stored through three ways in gas shales [24,26]:

The current production of oil and gas is 750-800 tonnes per day and 2.5-3 million cubic metres of gas, respectively. Exploration for assessing the Shale gas/oil prospectivity has been initiated in 4 basins of the country viz., Cambay, KG, Cauvery and A&AA Basins.

ONGC - Shale Gas

Although the shale gas potential of many nations is being studied, as of 2013, only the US, Canada, and China produce shale gas in commercial quantities, and only the US and Canada have significant shale gas production. While China has ambitious plans to dramatically increase its shale gas production, these efforts have been checked by inadequate access to technology, water, and land.
