D-Jetronic (1967–1979) Analogue fuel injection, 'D' is from German: "Druck" meaning pressure. Inlet manifold depression ( vacuum) is measured using a pressure sensor located in, or connected to the intake manifold, in order to calculate the duration of fuel injection pulses. Originally, this system was called Jetronic, but the name D-Jetronic was later created as a retronym to distinguish it from subsequent Jetronic iterations.

Bear this in mind, and don't be overly hasty to jump on fuel injection as the cause when there's a problem. System Overview: D-Jet is a "multi-port," electronically-controlled system that permits greater precision in metering an optimum fuel / air mixture than do carburetors, resulting in generally increased power and fuel economy.

DJetronic Fundamentals. D-Jetronic History and Fundamentals. History. The D-Jetronic system developed by Bosch in the early 1960's was the first mass-production electronic fuel injection system. It was primarily based on patents that Bosch licensed from the Bendix corporation. Bendix developed the basic idea of using an inductive element coupled to manifold vacuum as a component in a loop circuit ("multivibrator") to develop the basic injection pulse width.

Bosch D-Jetronic. The four-cylinder Porsche 914 saw Porsche's first application of electronic fuel injection. Porsche had actually briefly considered Bosch's D-Jetronic (the "D" stood for druck, the German word for pressure) for use in the 911, but MFI proved to be better suited for the high-revving 911 engine.

First, it's used to dampen out pulsation in the fuel from the fuel pump. This is apparently to 'deaden' noise from the pump, but to what end, I'm not sure. The other, more important function, is to hold pressure in the fuel lines when the engine is shut off, to assist with hot starting and reduce the possibility of vapour lock.
