...

OLTP systems are not always good for handling aggregates over large amounts of data, although there are exceptions, such as a well-planned SQL Server-based solution. Analytics against the data, that rely on aggregate calculations over millions of individual transactions, are very resource intensive for an OLTP system.

Setting this depends on the type of SQL Server workload, set this to 15-20 and possibly higher for OLTP type workloads, the aim being to minimize parallelism and pursue greater concurrency. For DSS/OLAP/Data Warehousing type workloads, consider leaving this at its default and managing parallelism through MAXDOP if concurrency is a problem.

SQL Server is an ACID-compliant database, which means that all transactions must be fully completed or completely failed and rolled back to maintain data integrity. Transactions can create, read, update, and delete (CRUD) data in the database; thus, all these operations need transactional consistency support even in the absence of explicit BEGIN and END transaction statements.
