In both cases, the assessment of the seismic response is evaluated in sound conditions and at the end of the service life (50 years) for different scenarios of a moderate corrosion attack. Pushover analyses are performed considering gravitational and seismic loads, by following a concentrated plasticity approach with lumped hinges assigned at the ends of the beams and the columns.

2. Rapid seismic assessment of existing R.C. buildings. In order to be fast and easy to implement, preliminary seismic assessment of existing structures ought to rely only on easily accessible input, such as geometric details and elementary information regarding material properties and reinforcing details, with no need of invasive diagnostics.

This section describes the Initial Seismic Assessment (ISA), which is the recom mended first step in the overall assessment process. It is intended to be a coarse evaluation involving as few resources as reasonably possible. Figure . B.1 summarises the main elements of the ISA. It also highlights that the continuum

The Engineering Assessment Guidelines (the guidelines) provide a technical basis for engineers to carry out seismic assessments of existing buildings within New Zealand. The guidelines support seismic assessments for a range of purposes, and must be used by territorial authorities to decide whether or not a building is earthquake prone in terms of the Building Act 2004.

Furthermore, with the use of SeismoStruct and SeismoBuild, two software packages specialised in the analysis, assessment and strengthening of existing structures, the students will learn how to carry out the full assessment and strengthening procedures of existing structures, from the structural modelling, through to the analysis and the checks according to the selected Codes (ASCE 41-17, Eurocode 8 Part-3, Italian and others).

Seismic Assessment & Retrofitting of Existing RC ...

In particular, the seismic rehabilitation of older concrete structures in high seismicity areas is a matter of growing concern, since the structures which are vulnerable to damage must be identified and an acceptable level of safety must be established. To make such an assessment, simplified linear- elastic methods are not adequate.

Seismic Vulnerability Assessment of Existing RC Building ...

Seismic risk assessment can be defined as a combination of seismic hazard and vulnerability. Seismic hazard depends upon geology of the area under consideration and is, therefore, site specific. Seismic vulnerability depends upon: The material of which the structure is made.

The study covered low- and midrise RC buildings because they represent the majority of buildings in Qatar. For the first time in Qatar, a number of existing buildings were selected and analyzed for both wind and seismic loads in accordance with the ACI and ASCE standards with the accelerations from the 2014 Qatar construction standards update.

The book outlines appropriate structural systems for many types of buildings, explores recent developments, and covers the last two decades of analysis, design, and earthquake engineering. It specifically addresses seismic demand issues and the basic issues of structural dynamics, considers the "capacity" of structural systems to withstand seismic effects in terms of strength and deformation, and highlights the assessment of existing R/C buildings under seismic action.
